Robot Rhythm level and skin setup

Use this when adding a level like Space. You'll need the Feature 5 project version to see the Skin reward field.

1. Get the level ready

If the scene already exists, use that. Otherwise, open **Assets/Scenes/Levels**, select a working scene, and press **Ctrl+D**. Rename the copy, then open it before making changes.

Set up the new background, obstacles, beatmap, and gameplay song. Test the scene first. Don't add a blank card while the level is unfinished; it will still show up in the menu.

2. Add it to the level menu

Open **Assets/Scenes/MainMenu.unity**. Search the Hierarchy for **LevelCard** and select it. In the Inspector, expand **Level Carousel > Levels**. Scroll down and press **+**.

Fill in the new entry. Unity may copy the previous entry, so check each field. This is what the existing City entry looks like:

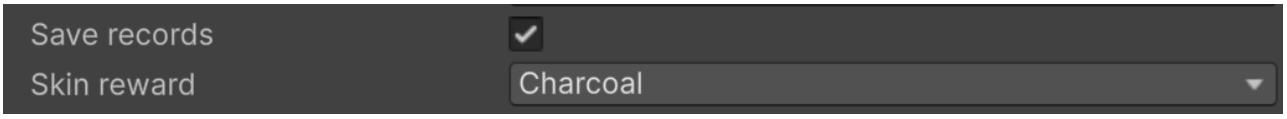

Title: the name shown on the card, like SPACE.
Scene: drag in the new level scene.
Cover image: drag in the card artwork.
Preview song: drag in the AudioClip for the menu preview.

Put card art in **Assets/UI/Resources/LevelCovers**. Use a 16:9 image, such as 1280 x 720. Leave out the title and paper frame; the menu adds them. This image and song are only for the card, not the gameplay scene.

Check **Save records** for normal levels. Leave it unchecked for Tutorial.

3. Connect the skin

Once the Scene is set and Save records is checked, open **Skin reward**. For Space, choose **Space - available**.

Available means the skin has not been assigned yet. A **checkmark and greyed-out name** means another level already uses it. These checkmarks are just for setup, not the player's unlocks.

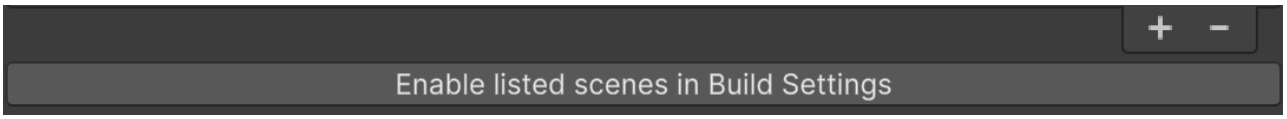

City uses Charcoal, Desert uses Sandstone, Ice uses Glacier Blue, and Mountain Range uses Burnt Orange. Space is still available.

After you assign it, the player sees **Complete SPACE to unlock** under the locked skin. Finishing that level unlocks it. To move a skin, set its old level's reward to **None** first. If you rename the level, choose None and assign the skin again to update that text.

Classic and Gold are handled separately. Gold stays hidden as **???** with **????????** underneath. Adding a new scored level also adds it to the requirement for earning Gold. Players who already have Gold keep it.

4. Save it and check it works

Below the list, click **Enable listed scenes in Build Settings**, then save MainMenu.

Start from the main menu and check:
• The card shows the right art and plays the right music.
• Tapping it opens the right level.
• Finishing the level saves the score and accuracy, including after Retry.
• The skin unlocks after completion and works during gameplay.
• Tutorial still has no saved records or skin reward.

For unlock testing, turn off the all-unlocked preview setting. The locked/unlocked toggle only changes the preview. Existing completion records may already unlock a skin.

Keep the scene, art, audio, and their .meta files with the MainMenu changes. Include **Assets/Feature5/SkinLibrary.asset** too; that stores the skin assignments.
